

Enterprise Publisher and QIS-Client

Even though a large number of organizations are still implementing command, control and supervision, there is a clear tendency toward involving all employees and delegating decision making and responsibilities as part of the implementation of change.

QualiWare Enterprise Publisher and QIS-Client

To stay competitive businesses need to react rapidly to market dynamics. Decision making and implementation of required transformations are made difficult by the complexity in business and the fact that for most people change is viewed negatively.

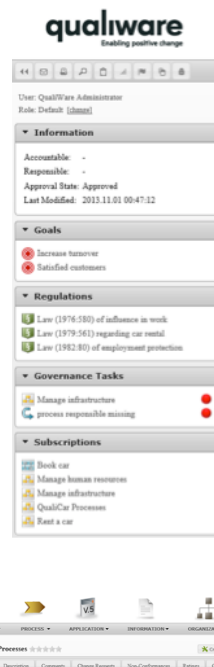

Coherent knowledge about the business must be captured, managed and analyzed. Consensus is required among all relevant stakeholders and employees to ensure successful implementation of transformation initiatives.

To support this consensus model and the collaborative approach we have released the QualiWare Enterprise Publisher (QEP) and QualiWare Integration Server - Client (QIS-Client) that enables web based collaboration and maintenance of knowledge content in the repository. This platform supports collaborative decision making, social collaboration, social analytics and delegation of responsibilities for information sharing. It enables a culture designed for change and motivates employees to use their social relations to improve business performance.

Our entire portfolio of web-based collaboration products share fundamental features with social communities.

There is an individual area that reflects the user requirements, the user role and user access rights. Special features allow for role based functionality and personal targeted information, so users are presented with a relevant and not too complex web based front end. This personalized approach ensures that the end-user always has a positive experience when browsing the enterprise repository.

and the feature bar are automatically adjusted to meet individual user's need.

Default publishing layout for QualiWare Enterprise Publisher

The actual models and knowledge content is presented in a shared area acting as a 'wall' for the object. This wall includes all aspects of the artifact in focus and acts as a navigation path to other objects in the landscape.

And while the QualiWare Enterprise Publisher is responsible for individually managed and secure publishing of information only, the QIS-Client extend this functionality with a Wiki-like ability to capture new or modified information objects and relationships from the web-based front end. This will allow modern innovative organizations to delegate responsibilities for maintenance of corporate knowledge to ALL employees.

QualiWare Enterprise Publisher and the QIS-Client together act as a collaboration platform that includes social features such as:

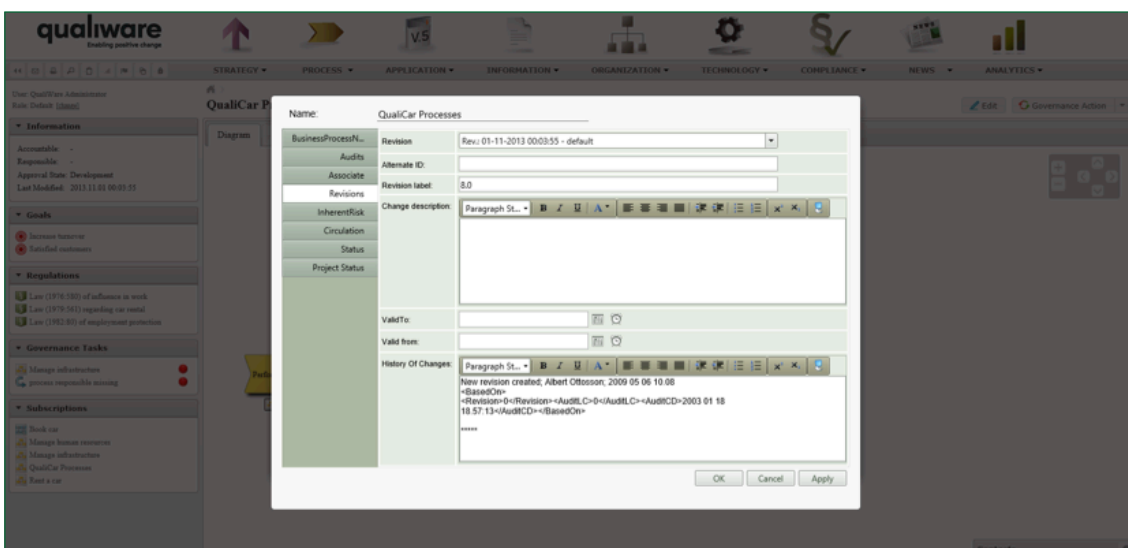

- Rating of objects
- Commenting, submitting change requests or other feedback
- Using embedded secure chat feature to discuss and share work with connected colleagues
- Accessing personal governance tasks controlled by the QualiWare Governance Workflow Engine
- Analyzing object context landscapes and change impact

- Creating new revisions of objects, sending changes into circulation or approving finalized object work
- Subscribing to areas of interest
- Evaluating KPI's and performance statistics related to focus area
- Assess social analytics and run diagnostics on the social behavior of the users of the enterprise repository content

QualiWare Enterprise Publisher and the QIS-Client together enables modern consensus based management thus embracing the 'next practices' for organizational change defined by Gartner; Social BPM, Extreme Collaboration, Organizational Liquidity and Hybrid Thinking.

QualiWare Enterprise Publisher integrates with QualiWare Governance Workflow Engine and QualiWare Social Behavior Warehouse and may be extended with more specific features via the QualiWare Compliance, Audit and Improvement product and QualiWare Document Management.

It makes EA artifacts, corporate knowledge, models and other type of content available for employees everywhere at any time, and it supports responsive design and mobile technology.

A Wiki-like functionality is provided by the QIS-Client. This allows the user to modify objects and their relationships from the web.
